## Description:

RDL's RU-VSQ4 Video Sequencing Switcher provides sequential vertical-interval (to eliminate/minimize screen roll) switching between (up to) four video cameras, pausing from one to fifteen seconds on each image. The sequence interval is adjustable on a recessed front panel control.

The RU-VSQ4 provides a loop-through output from each camera to facilitate connection of additional monitors or recorders. The security agent can press any source pushbutton to continuously view that particular source, then press the button again to resume sequencing. Open-collector outputs are provided on the rear panel for audio-follow-video switching, tally indicators or other control.
