BOARDROOM AUDIO POWER AMPLIFICATION VCA Controlled Audio Amplifier with Matching Remote Control and Input Connector Plates

Description:

RDL passive input plates are used to connect audio and video from the boardroom to a central equipment rack for processing and recording. The D-AVMB2 Audio and Video Jack plate is used for a laptop computer; the D-XLR3F XLR Female Jack plate is used for the lectern microphone.

The line output of the audio mixing/switching equipment in the rack feeds an RDL RU-PA40D Stereo Audio Amplifier. The amplifier is equipped with an internal VCA which is controlled by the RLC10K Remote Level Control that matches the style of the input plates.

The RU-PA40D provides ample compressed audio power to meet the requirements of both small and large boardrooms and conference rooms.
